

[Spider Jet for Intake Manifolds]

Abstract

The Spider Jet is an air redistribution system that can be fit on the intake manifold on any internal combustion engine. The Spider Jet is unique because it does not force additional air into the manifold, but rather redistributes the air already in the manifold to a more strategic location, which creates a better fuel to air mixture for the engine to consume. The better fuel to air mixture improves the horsepower of the engine, but also greatly improves the fuel efficiency of the engine.
